

Agent-ready commerce still needs a human boundary.

Agentic commerce can make catalog, cart and transaction flows callable by AI. LHINOS focuses on the layer before and around execution: what the human actually means, what remains uncertain and what authority exists before a consequential commercial commitment.

Commerce integration & execution

Shopify, commerce integrations, product data, cart, checkout and agent-ready transaction infrastructure remain the commerce system.

Human intent + authority boundary

Intent and meaning before product selection; bounded human authority before an agent creates an external commercial commitment.

CORE QUESTION

Can agentic commerce become more capable without silently turning capability into transaction authority?

Smallest credible proof

Separate discovery capability, commerce permission and human authority before commitment.

01	Capability without authority	DENY
02	Explicit human handback	HUMAN CONFIRM
03	Bounded grant / grounded continuation	ALLOW
04	Unknown critical variable	CLARIFY / DENY
05	Existing technical policy blocks	BLOCKED
06	Decision evidence reconstructed	PASS / FAIL

FALSIFIER

If the existing commerce stack already preserves human intent before product selection and independently enforces bounded human authority before consequential agent transactions, with non-self-widening and reconstructable evidence, the LHINOS fit must narrow or stop.
